ArtiCheck: Artifact Evaluation Fixture

Teaching artifact. This document is not a published research paper.

Evaluation scope: verify the reported score, split integrity and training budget.

The supplied probe prints a JSON object for deterministic verification.

Table 1. Classification result

Metric: macro F1. Reported score: 0.7777777778. Tolerance: 0.000001.

Macro F1 is the arithmetic mean of the class-wise F1 values.

The injected metric_average defect reports another averaging method.

Artifact files: probe.py, experiment.json.

Command: python3 probe.py

Expected output key: macro_f1.

Experimental protocol

Data split: training and test data do not overlap.

Training sample IDs: train-1, train-2, train-3.

Test sample IDs: test-1, test-2.

Baseline: method and baseline use the same number of training steps.

Method training steps: 100. Baseline training steps: 100.

The exercise demonstrates three independent checks:

a reported metric, disjoint split IDs, and equal baseline budgets.

A successful probe run does not establish full-paper reproducibility.
